

Jetbrains Teamcity is a brilliant continuous integration and deployment platform. Being a modern platform, it also provides a REST api. But sadly, the API documentation is, well... **something**.

But it seems, as if JetBrains is getting there. There's an undocumented endpoint in the API, that provides a swagger API description file. So, until JetBrains hosts something themselves, I've created a **repository** and used swagger-codegen to generate a static html documentation, that's still far from good, but at least has **some** structure.

Go ahead and check it out. I try to update the repository with new versions of Teamcity until JetBrains reacts.
