Dear diary,

it's been some days since I wrote to you about my experience with **creating a Terraform documentation lookup app** and while I'm using tflookup on a daily, I noticed something.

When I start my work in the morning and have the first interest in looking up some provider resource of Terraform, I naturally check out tflookup. And that is no fun experience, because I have to wait and waiiiiit until tflookup finally comes up.

That's because, Heroku has something they call **dyno sleeping** for the free subscription and as not many other people tend to use tflookup currently, the app gets all sleepy and falls into a deep slumber until I wake it up in the morning.

I don't want to pay Heroku for this little side project of mine and being a simple Node.js app, that is easily deployable, I simply deployed it on my server, that I manage for years (and that is already active rebuilding the tflookup index each night)

So from now on, I will be checking out **tflookup on a new address**.

Yours
Dennis
