

I'm currently migrating my 8.0.6 (yes, I skipped the 8.0.7 for no apparent reason!) setup to the current 8.5 and these are some notes about the changes I found:

==== Systems administrators =====

- * The localconfig-variable „postfix_virtual_alias_maps“ (that allows you to alter the postfix setting „virtual_alias_maps“) doesn't exist anymore and was moved into the main configuration as the attribute „zimbraMtaVirtualAliasMaps“
- * Zimbra has compiled Postfix without Berkeley-DB-Support and so the „hash“-dictionary type is not available anymore. It can safely be replaced with „texthash“. So if you customize your postfix installation, you need to alter the dictionary type.
- * When you were accustomed to changing parameters in Jetty's *.web.xml.in-files and restarting zmmailboxdctl, you'll have no luck in 8.5. You'll have to restart zmconfigdctl first to have the changes take effect.

==== Developers =====

- * The ZmHtmlEditorColorPicker is gone. However, you can safely use DwtButtonColorPicker instead
- * The zimlet-method „getMailCellStyle“ isn't called anymore (there's a note about providing a better method in the sources) see https://bugzilla.zimbra.com/show_bug.cgi?id=95344
- * The class „DwtHtmlEditor“ is gone. Zimbra uses its own „ZmHtmlEditor“. Constants like DwtHtmlEditor.HTML are now in Dwt (Dwt.HTML)
